

# Simris Group AB Announces Positive Results from Ongoing Antibody-Drug Conjugate (ADC) Study with Nuvisan

**Simris Group AB's wholly owned subsidiary, Simris Biologics GmbH, today announced important progress in its ongoing preclinical study with Nuvisan, a leading European contract research and development organization.**

Three proprietary **Microcystin (MC)**-based payloads were successfully generated in **ADC format** and evaluated in in-vitro efficacy studies. In two independent trials, **one of the ADC variants demonstrated full-blown toxicity against the corresponding antigen-expressing cancer cell line**, indicating complete elimination of cancer cells in response to treatment.

This payload candidate, now designated **SIMRIS-121**, having exhibited excellent potent in-vitro activity, will proceed to the **next stage of the Nuvisan study**—a **dose-escalation in-vivo study** to determine the **maximum tolerated dose (MTD)** of the ADC in mice.

"This is a significant milestone for our Microcystin ADC program," said **Dr. Alexis Roberts-McIntosh, CEO of Simris Group AB**. "The clear demonstration of full cytotoxicity in one of our MC-ADC candidates confirms the therapeutic potential of our cyanobacterial payload platform. Together with Nuvisan's deep expertise in preclinical development, we are advancing rapidly toward in-vivo validation."

These results further support **Simris' mission to develop novel, cyanobacteria-derived toxin payloads** with improved therapeutic windows and differentiated mechanisms of action for next-generation ADCs.
