

Freemelt receives order for Freemelt ONE from Belgian Sirris

Freemelt has received an order for its research system Freemelt ONE from Sirris, Belgium's leading independent research and development center for the technology industry. This marks Freemelt's first machine installation in Belgium and represents an important step in strengthening the company's presence in the Belgian market. The order value amounts to approximately SEK 3.8 million, with delivery planned for the second quarter of 2026.

Freemelt ONE will be used in Sirris' industry-driven development projects, enabling companies to perform feasibility studies and proof-of-concept work without requiring upfront capital investments. This provides Belgian companies in sectors such as aerospace, space, energy, medical technology, and other advanced material applications with the opportunity to evaluate E-PBF technology. At the same time, the installation increases Freemelt's visibility among organizations actively seeking next-generation manufacturing technologies.

Sirris is one of Belgium's most influential research environments, collaborating annually with more than 1,500 industrial companies across its eight facilities. As a neutral and industry-focused actor, Sirris serves as a central platform for companies looking to assess and develop advanced manufacturing methods. The installation of Freemelt ONE is strategically important, as the machine will be placed in an environment where many Belgian companies gain exposure to new production technologies. This strengthens the position of Freemelt's E-PBF technology and creates opportunities for national and European research collaborations, in which Sirris has long been an active participant.

"Freemelt's open E-PBF technology provides us with a flexible platform for advanced materials, an area where we see rapidly growing demand. It strengthens our ability to support industry in development projects," says Olivier Rigo, Senior Lead Additive Manufacturing, Sirris.

"The installation of Freemelt ONE at Sirris – one of Europe's most respected research environments, is an important step in our European expansion. Sirris' strong industrial network ensures that our technology becomes a natural part of many companies' development projects. We see significant potential for this installation to lead to further collaborations and new business opportunities in Belgium," says Daniel Gidlund, CEO of Freemelt.

About Us

Freemelt develops advanced 3D printers for metal components and aims to become the leading supplier in additive manufacturing (AM) using E-PBF technology, targeting SEK 1 billion in revenue by 2030. The solutions primarily support companies in the defense, energy, and medical technology sectors in Europe, U.S. and Asia, enabling them to drive innovation and improve production efficiency. Founded in 2017, Freemelt has expanded its product portfolio to include three printer models, with two designed for industrial production and one (Freemelt ONE) targeting research institutes and universities. The modular industrial printers (eMELT) leverage E-PBF technology, delivering significantly higher efficiency compared to other machines on the market while maintaining flexibility in metal selection.

Freemelt generates revenue primarily through the sale of advanced 3D printers at fixed prices, complemented by support and maintenance services, which are expected to account for 25% of total revenue by 2030.

The company is now focused on further industrializing its product and service portfolio and driving commercialization in the European, North American, and Asian markets. Read more at www.freemelt.com
