

Tamtron Group Oyj will introduce revolutionary AI-based automatic material recognition system

Tamtron Group Plc | Press Release | April 15, 2024 at 10:00:00 EEST

Tamtron Group Oyj, a forerunner in the field of weighing technology and digital weighing services, has developed an advanced AI-based system which automatically recognizes the materials loaded on lorry in real time. This unique innovation is designed to improve the management of material flows and enhance the recycling processes by revolutionizing the traditional concept of material handling in industry and recycling.

The system will be available during the second half of 2024 and it utilizes advanced image recognition technology to ensure that e.g. the materials delivered to recycling plants are exactly what has been agreed. Automatic recognition saves labour costs and enables round-the-clock service with low costs. It offers a useful approach to direct materials to correct storage locations which in turn optimizes transport routes and ensures that materials are unloaded to correct spot.

Traffic safety improves as the system analyses the position of the load on the lorry and ensures that the load is covered before departure for road traffic in case the load needs to be covered. This innovation is available as a module for Tamtron's comprehensive digital mScales weighing service, which offers the customers a wide range of solutions for weighing and logistics management.

Tamtron has various pioneering solutions based on weighing technology and services, which help our customers to save costs, secure their business and meet the regulatory requirements. The business of many Tamtron's customers heavily relies on weighing information.
