

Vivesto presents Paccal Vet data at the WSAVA World Congress 2026

Solna, Sweden, October 13, 2026 – Vivesto AB, an oncology-focused development company, today announced that the recently reported topline data from the company's Paccal Vet clinical studies in dogs and cats are being presented at the World Small Animal Veterinary Association (WSAVA) World Congress 2026, through an oral poster presentation and an e-poster, further increasing the international scientific visibility of the Paccal Vet program.

"Presenting our Paccal Vet program at the WSAVA World Congress shortly after announcing positive topline results from both our clinical studies represents an important opportunity to discuss the continued development of the program with veterinarians and key opinion leaders from around the world. Together with our recent participation at the Veterinary Cancer Society Annual Conference, these presentations continue to strengthen the scientific visibility of Paccal Vet within the international veterinary oncology community," said Erik Kinnman, CEO of Vivesto.

The oral presentation includes the most recent survival and safety data from the Paccal Vet (paclitaxel micellar) pilot study in dogs with stage I-II splenic hemangiosarcoma (HSA) following splenectomy, confirming the positive interim results reported by Vivesto in November 2025, which support progression to a pivotal study following completion of the pilot study. Recruitment in the study was completed in June 2026, and topline results were reported in September 2026.

The e-poster presents safety and preliminary anti-tumor activity data from the Paccal Vet dose-escalation study in cats with spontaneous solid tumors, supporting the tolerability of Paccal Vet in cats and suggesting encouraging single-agent anti-tumor activity. Completion of recruitment and determination of the maximum tolerated dose (MTD) were announced in July 2026, topline results were presented in September 2026, and final results are expected later this year.

The WSAVA World Congress, taking place October 13–15, 2026, in Warsaw, Poland, is one of the largest international scientific meetings in companion animal medicine, bringing together veterinarians, researchers and industry representatives from all over the world. The congress provides an important forum for scientific exchange and clinical education across a broad range of veterinary specialties, including oncology.

Oral presentation

Title: *Interim Survival and Safety of Paclitaxel Micellar in Dogs with Stage I-II Splenic Hemangiosarcoma After Splenectomy*

Authors: K. Couto, B. Wittenberns, J. Couto, C. Tripp, S. Shor, M. Miller, J. Bertout, G. Kung, J. Perry, T. Fernandez-Zafra

Presented by: Teresa Fernandez-Zafra, Chief Scientific Officer at Vivesto

Session Hall: Workshop Room 2

Presentation date and time: October 13 at 09:00 – 10:35 CEST

E-poster

Title: *Dose-Escalation Study of Paclitaxel Micellar in Cats with Spontaneous Solid Tumors*

Authors: K. Couto, M. Dowling, K. Hovis, L. Junge, J. Bertout, J. Perry, T. Fernandez-Zafra

About Vivesto AB

Vivesto is a Swedish development company that aims to offer new treatment options for hard-to-treat cancers where there are major medical needs and significant market potential. The project portfolio consists of Cantrixil, which is being developed for blood cancer, and the veterinary oncology program Paccal Vet (paclitaxel micellar), which is being evaluated in a pilot clinical trial in dogs with splenic hemangiosarcoma following splenectomy and in a dose-finding study in cats with solid tumors. Vivesto's shares are traded on Nasdaq Stockholm (ticker: VIVE). Visit www.vivesto.com for more information about Vivesto.

About Paccal Vet

Vivesto's drug candidate Paccal Vet consists of paclitaxel formulated with the company's proprietary XR-17 technology, which enables solubility without the undesirable effects of traditional formulations containing solvents. The absence of the solvent cremophor, to which cats and dogs are particularly sensitive, may reduce the risk of serious side effects and death associated with treatment.

Paccal Vet also does not require the addition of human albumin, which when used in cats and dogs can cause hypersensitivity reactions and reduced treatment effectiveness. Previous clinical studies performed by Vivesto have demonstrated safety in more than 300 dogs. Anti-tumor activity has also been shown in squamous cell carcinoma and non-resectable mammary carcinoma of stage III-V. Vivesto is also conducting a Paccal Vet dose-finding study in cats with solid tumors.

About hemangiosarcoma in dogs

Hemangiosarcoma is one of the most common malignant cancers in dogs and is associated with a poor prognosis, with less than 10 percent of dogs surviving 12 months. The number of dogs diagnosed with hemangiosarcoma annually in the US and Europe is approximately 75,000 per market. Dogs with hemangiosarcoma rarely show clinical symptoms until the tumor has grown very large and spread. Hemangiosarcoma usually affects older dogs (>8 years) of all breeds. The tumor normally appears on the spleen, right heart base or liver, but can also be found on the skin and other sites such as the bones, kidneys, bladder, muscles, mouth and central nervous system.

Treatment options for hemangiosarcoma include surgery and, for some of the dogs, an unapproved adjuvant chemotherapy. The median survival time for dogs with hemangiosarcoma of the spleen undergoing surgery alone is approximately 1-3 months, depending on the stage/seriousness of the disease. No regulatory approved cancer medicines are used for the treatment of hemangiosarcoma in dogs. However, chemotherapeutic agents developed for human use are used off-label in dogs to manage residual metastatic disease after surgery. The most common such chemotherapy program in use today can extend survival with hemangiosarcoma of the spleen by 2-4 months.

About cancer in cats

The need for safe and effective cancer treatment in cats is vast and increasing as the number of pets grows. Estimates indicate that there are more than 95 million cats in the United States alone and approximately 6 million of those are diagnosed with cancer each year. There are currently no approved drugs for the treatment of cancer in cats and current paclitaxel formulations are not tolerated by cats and therefore cannot be used.
