Triona launches ECO for more efficient transport and production

Triona further strengthens its position and continues to lead the development of digital solutions for the infrastructure industry with the launch of Triona ECO – Energy and Cost Optimizer, an advanced decision support system that sets new standards for planning, production, and reporting within infrastructure.

Asphalt production is an energy-intensive process with a significant environmental impact. At the same time, the requirements are increasing for traceability and transparency throughout the whole value chain – from raw goods to the finished asphalt product. Triona meets these challenges with a solution which not only reduces CO_2 emissions and power consumption but also strengthens customers' competitiveness through increased efficiency and cost control.

"Triona's ECO gives our customers a powerful tool to optimize the complete process. It is about combining environmental responsibility with business value – something that we know is valued by both our customers and shareholders", says Lena Ridström, CEO Triona AB.

Triona ECO offers:

- Data driven planning of raw materials, production, documentation, and transportation.
- Sensor-based optimization of production temperatures and energy usage.
- Simplified collection of environmental data which can support environmental reporting and EPDs (Environmental Product Declaration).
- A planning module for jobs, roads and, transportation that seamlessly integrates with existing systems.

This initiative is a significant part of Triona's strategy to be a leading actor within sustainable digitalization of critical infrastructure. By combining technical innovation with vast industry knowledge, we create long-term value – for our customers, society, and our shareholders.
