

Now the distance between idea and production are shortened in the electronic industry

Today the fast growing electronic manufacturer NOTE starts up a prototype workshop in Electrum, Kista. This means that the companies and institutions located there get direct access to expertise regarding production of prototypes.

- The majority of the development companies within telecom and electronics are located in Kista says Sten Dybeck, head of the NOTE group. We can now offer them a much shorter distance from idea to production in a close teamwork between constructor and producer.

The NOTE prototype workshop is manned with specialists that immediately can take care of and produce prototypes in accordance with the ideas of the electronic companies. The main part of the production take place on the location, which means that the buyer can follow the whole process up close, if so desired. This co-operation will be very important both for quality and speed.

The effort on a prototype workshop and meeting place in Kista is a part of the offensive expansion from NOTE right now. The company is unique in the Swedish telecom industry and is among other things on the list over Swedish growth companies for the fifth year in a row.

- There are many explanations to why we grow when others decrease, says Sten Dybeck. Among other things we have managed to create a good company spirit with skilful and interested co-workers. But I think most important is the way we take care of our customers. We want to grow with them. In that respect the effort in Kista is very important.
