

## Press release

Date: November 4, 2021

# IAR Systems updates its products for efficient development and automated testing with support for Linux and Windows

Stockholm, Sweden—November 4, 2021—IAR Systems, the world leader in software tools and services for embedded development, now provides IAR Build Tools for Arm with support for Linux and Windows installations, further extending IAR Systems' offering for flexible automated workflows with automated builds. Supporting implementation in cross platform-based frameworks for automated application build and test processes, the tools enable large-scale deployments of critical software building and testing.

To ensure efficiency, software development environments need to be scalable and flexible. Today's development practices also require that organizations have automated processes that ensure quality all the way from development into building and testing. IAR Build Tools are able to streamline these processes and make it possible for organizations to optimize resources when it comes to the time developers spend in their projects, as well as to manage and utilize licenses and servers in an optimal way

"The use of CI/CD environments is growing among our customers and we now enable them to use IAR Build Tools for Arm in the platform of their choice," said Anders Holmberg, Chief Technology Offer, IAR Systems. "Many customers already appreciate the efficiency and flexibility achieved by using our build tools for Linux, and by further extending our offering across multiple platforms, we enable even more customers to integrate our powerful tools into their automated build workflows."

### Ends
