

## Clavister Wins PoC for Swedish Armed Forces to Secure Satellite Communication

**Clavister, a leader in high-performance, AI-based cybersecurity solutions, has been awarded a Proof of Concept (PoC) contract by Swedish Defence Material Administration (FMV), a government agency which reports to the nation's Ministry of Defence (MoD), and the primary provider of equipment to the nation's armed forces. As part of this PoC, Clavister will provide specialised cyber security technology that will enable military organisations to detect disturbances in satellite communications.**

To win the contract, Clavister participated and competed in FMV's ['TechDay'](#) – the agency's military innovation program, which aims to identify new technologies that have the potential to enhance the capabilities of the armed forces. This edition focused on space technology and while competing against some of the most innovative companies, Clavister and its proposal with the cutting-edge technology was chosen as the standout contestant.

Innovation in space is an essential part of achieving military advantage for Europe and cyber security needs to be embedded right at the heart of developing new innovative space technologies. We can expect the broader space sector to benefit from this work.

Stefan Brodin, Head of Defence Solutions at Clavister, commented: "We are proud to have been awarded this contract and to have been chosen as the most innovative solution provider among a group of hugely impressive businesses. This win underlines the strength of our capabilities across industries and is a specific signal of intent for the applications of our AI technologies to the space sector."

Clavister has strong experience within the defence sector, providing cyber security solutions to secure military platforms and equipment. Clavister already works with large defence contractors like [BAE Systems](#) to deliver military-grade cybersecurity and protection for NATO-compliant combat vehicles.

Nils Undén, Clavister's CTO, said: "There has never been a more important time to ensure our core communications networks are secured from disruption and malicious attacks. Nowhere is that more crucial than in the military and its satellite systems, and we look forward to collaborating with the FMV on an ongoing basis to ensure that work is done to the highest standard.

"This win is an important milestone for us, but only the first step in what I am confident will be a long journey of exploration and refinement."
