

Press Release 7 June 2016

Infant Bacterial Therapeutics enrolls First Patient in Phase 2 Clinical Trial

Infant Bacterial Therapeutics AB (publ) ("IBT") announces that the first premature infant has been enrolled and dosed in the Company's Phase 2 clinical trial. This Phase 2 trial is a randomized, double blind, parallel group, dose escalation, placebo-controlled multicenter study to investigate the safety and tolerability of IBP-9414 administered in preterm infants.

This is the first trial in the clinical development of IBP-9414 for the prevention of the often fatal disease necrotizing enterocolitis which affects premature infants. The multicenter trial is being conducted in a number of neonatal intensive care units in the US and will enroll 120 premature infants.

More information about the clinical trial can be found on ClinicalTrials.gov (ClinicalTrials.gov identifier: NCT02472769).

Staffan Strömberg, Chief Executive Officer of IBT, comments, "We are very excited to have started the study and to now have the first baby included. This is an important milestone in our development of this potentially life-saving new drug."
