

Realheart releases footage from the animal trial surgeries

In 2019, Realheart conducted a series of animal trials on sheep with the aim of verifying the technology for its artificial heart. The goal of these trials has been to be able to wake up the animal and keep it awake for at least ten hours. For the first time, the company is now publishing film material showing the nature of these operations.

Scandinavian Real Heart AB develops a total artificial heart (TAH) for implantation in patients with life-threatening heart failure. Realheart TAH has a unique, patented design that resembles that of the natural human heart. The artificial heart consists of a four-chamber system (two atriums and two chambers) which provides the opportunity to generate a physiologically adapted blood flow that mimics the body's natural circulation. A unique concept in the medical technology world.
